| Question<br>Number     | Scheme                                                                                                              | Marks        |
|------------------------|---------------------------------------------------------------------------------------------------------------------|--------------|
| <b>1.</b> ( <i>a</i> ) | $\ln 3x = \ln 6$ or $\ln x = \ln \left(\frac{6}{3}\right)$ [implied by 0.69] or $\ln \left(\frac{3x}{6}\right) = 0$ | M1           |
|                        | x = 2 (only this answer)                                                                                            | A1 (cso) (2) |
| <i>(b)</i>             | $(e^{x})^{2} - 4e^{x} + 3 = 0$ (any 3 term form)                                                                    | M1           |
|                        | $(e^x - 3)(e^x - 1) = 0$                                                                                            |              |
|                        | $e^x = 3$ or $e^x = 1$ Solving quadratic                                                                            | M1 dep       |
|                        | $x = \ln 3$ , $x = 0$ (or ln 1)                                                                                     | M1 A1 (4)    |
|                        |                                                                                                                     | (6 marks)    |

Notes: (a) Answer x = 2 with no working or no incorrect working seen: M1A1 Beware x = 2 from  $\ln x = \frac{\ln 6}{\ln 3} = \ln 2$  M0A0  $\ln x = \ln 6 - \ln 3 \implies x = e^{(\ln 6 - \ln 3)}$  allow M1, x = 2 (no wrong working) A1

(b)  $1^{st}$  M1 for attempting to multiply through by  $e^x$ : Allow y, X, even x, for  $e^x$ Be generous for M1 e.g  $e^{2x} + 3 = 4$ ,  $e^{x^2} + 3 = 4e^x$ ,  $3 y^2 + 1 = 12y$  (from  $3 e^{-x} = \frac{1}{3e^x}$ ),  $e^x + 3 = 4e^x$ 

 $2^{nd}$  M1 is for solving quadratic (may be by formula or completing the square) as far as getting two values for  $e^x$  or y or X etc

 $3^{rd}$  M1 is for converting their answer(s) of the form  $e^x = k$  to x = lnk (must be exact) A1 is for ln3 **and** ln1 or 0 (Both required and no further solutions)

| 2.                                                                                                                                                                                   | <i>(a)</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | $2x^{2} + 3x - 2 = (2x - 1)(x + 2)$ at any stage                                                                                                                                                                                                                                                                                    | B1         |

- Notes: (a) Generous M for attempt at f(x)g'(x) + f'(x)g(x)1<sup>st</sup> A1 for one correct, 2<sup>nd</sup> A1 for the other correct. Note that  $x^2e^x$  on its own scores no marks
  - Note that  $x^2 e^x$  on its own scores no marks (b)  $1^{st}$  A1 (x = 0) may be omitted, but for  $2^{nd}$  A1 both sets of coordinates needed ; f.t only on candidate's x = -2
  - (c) M1 requires complete method for candidate's (a), result may be unsimplified for A1
  - (d) A1 is cso; x = 0, min, and x = -2, max and no incorrect working seen., or (in alternative) sign of  $\frac{dy}{dx}$  either side correct, or values of y appropriate to t.p.

Need only consider the quadratic, as may assume  $e^x > 0$ .

If all marks gained in (a) and (c), and correct x values, give M1A1 for correct statements with no working

|                        | T = 13.06 or 13.1 or 13                                                                                | A1 (3)           |
|                        |                                                                                                        | (7 marks)        |

Notes: (b) (main scheme) M1 is for  $(10+10e^{-\frac{5}{8}})e^{-\frac{1}{8}}$ , or  $\{10 + \text{their}(a)\}e^{-(1/8)}$ 

**N.B.** The answer is given. There are many correct answers seen which deserve M0A0 or M1A0 (If adding two values, these should be 4.724 and 8.825)

(c)  $1^{\text{st}}$  M is for  $(10+10e^{-\frac{5}{8}}) e^{-\frac{T}{8}} = 3$ 

 $2^{\text{nd}}$  M is for converting  $e^{-\frac{T}{8}} = k$  (k > 0) to  $-\frac{T}{8} = \ln k$ . This is independent of  $1^{\text{st}}$  M.

Trial and improvement: M1 as scheme,

M1 correct process for their equation (two equal to 3 s.f.) A1 as scheme
