### **Specimen Paper**

Additional materials: Answer booklet Graph paper List of Formulae (MF 1)

**TIME** 1 hour 30 minutes

#### **INSTRUCTIONS TO CANDIDATES**

- Write your Name, Centre Number and Candidate Number in the spaces provided on the answer booklet.
- Answer **all** the questions.
- Give non-exact numerical answers correct to 3 significant figures, unless a different degree of accuracy is specified in the question or is clearly appropriate.
- Where a numerical value for the acceleration due to gravity is needed, use  $9.8 \text{ m s}^{-2}$ .
- You are permitted to use a graphic calculator in this paper.

## INFORMATION FOR CANDIDATES

- The number of marks is given in brackets [] at the end of each question or part question.
- The total number of marks for this paper is 72.
- Questions carrying smaller numbers of marks are printed earlier in the paper, and questions carrying larger numbers of marks later in the paper.
- You are reminded of the need for clear presentation in your answers.

1 A particle is moving with simple harmonic motion in a straight line. The period is 0.2 s and the amplitude of the motion is 0.3 m. Find the maximum speed and the maximum acceleration of the particle. [6]

A sphere A of mass m, moving on a horizontal surface, collides with another sphere B of mass 2m, which is at rest on the surface. The spheres are smooth and uniform, and have equal radius. Immediately before the collision, A has velocity u at an angle  $\theta^{\circ}$  to the line of centres of the spheres (see diagram). Immediately after the collision, the spheres move in directions that are perpendicular to each other.

- (i) Find the coefficient of restitution between the spheres. [4]
- (ii) Given that the spheres have equal speeds after the collision, find  $\theta$ . [3]
- 3 An aircraft of mass 80 000 kg travelling at 90 m s<sup>-1</sup> touches down on a straight horizontal runway. It is brought to rest by braking and resistive forces which together are modelled by a horizontal force of magnitude  $(27\ 000+50v^2)$  newtons, where v m s<sup>-1</sup> is the speed of the aircraft. Find the distance travelled by the aircraft between touching down and coming to rest. [8]

4 For a bungee jump, a girl is joined to a fixed point *O* of a bridge by an elastic rope of natural length 25 m and modulus of elasticity 1320 N. The girl starts from rest at *O* and falls vertically. The lowest point reached by the girl is 60 m vertically below *O*. The girl is modelled as a particle, the rope is assumed to be light, and air resistance is neglected.

(i)	Find the greatest tension in the rope during the girl's jump.	[2]
(ii)	Use energy considerations to find	

<b>(a)</b>	the mass of the girl,	[4]
------------	-----------------------	-----

(b) the speed of the girl when she has fallen half way to the lowest point. [3]

 $40^{\circ}$ 1.5 m  $P \bullet 6.5 \text{ m s}^{-1}$ 

A particle *P* of mass 0.3 kg is moving in a vertical circle. It is attached to the fixed point *O* at the centre of the circle by a light inextensible string of length 1.5 m. When the string makes an angle of  $40^{\circ}$  with the downward vertical, the speed of *P* is 6.5 m s<sup>-1</sup> (see diagram). Air resistance may be neglected.

(i) Find the radial and transverse components of the acceleration of *P* at this instant. [2]

In the subsequent motion, with the string still taut and making an angle  $\theta^{\circ}$  with the downward vertical, the speed of *P* is  $v \text{ m s}^{-1}$ 

- (ii) Use conservation of energy to show that  $v^2 \approx 19.7 + 29.4 \cos \theta^\circ$ . [4]
- (iii) Find the tension in the string in terms of  $\theta$ . [4]
- (iv) Find the value of *v* at the instant when the string becomes slack. [3]

6

5

A step-ladder is modelled as two uniform rods *AB* and *AC*, freely jointed at *A*. The rods are in equilibrium in a vertical plane with *B* and *C* in contact with a rough horizontal surface. The rods have equal lengths; *AB* has weight 150 N and *AC* has weight 270 N. The point *A* is 2.5 m vertically above the surface, and BC = 1.6 m (see diagram).

- (i) Find the horizontal and vertical components of the force acting on *AC* at *A*. [8]
- (ii) The coefficient of friction has the same value  $\mu$  at *B* and at *C*, and the step-ladder is on the point of slipping. Giving a reason, state whether the equilibrium is limiting at *B* or at *C*, and find  $\mu$ . [6]

Two points *A* and *B* lie on a vertical line with *A* at a distance 2.6 m above *B*. A particle *P* of mass 10 kg is joined to *A* by an elastic string and to *B* by another elastic string (see diagram). Each string has natural length 0.8 m and modulus of elasticity 196 N. The strings are light and air resistance may be neglected.

(i) Verify that *P* is in equilibrium when *P* is vertically below *A* and the length of the string *PA* is 1.5 m.

[4]

[3]

The particle is set in motion along the line AB with both strings remaining taut. The displacement of P below the equilibrium position is denoted by x metres.

- (ii) Show that the tension in the string *PA* is 245(0.7+x) newtons, and the tension in the string *PB* is 245(0.3-x) newtons. [3]
- (iii) Show that the motion of *P* is simple harmonic.
- (iv) Given that the amplitude of the motion is 0.25 m, find the proportion of time for which *P* is above the mid-point of *AB*.
